COMFORT

A spring mattress is beneficial to an active sleeper who would otherwise find it hard to change positions in a memory foam mattress due to the slowly formed hull around the body. Also, compared to a foam mattress, a spring mattress does not give off substantial odors, as spring provide circulation of. A memory foam mattress, on the other hand, often a person to wake up the comfort of the mattress. With a memory foam mattress, portions of active sleepers can have less disturbance from movements on the other side of the bed.

SUPPORT

A spring foam mattress provides support using the coils that push back to the pressure of the body, achieving even support because of varying forms of body parts. Memory foam offers even pressure relief to the sleeper as it forms hull to the curvature of the body. Side sleepers often do not get proper support for their spine as well as pressure relief from a spring mattress that is too firm, as a memory foam mattress is more pliable. Back and stomach sleepers, on the other hand, can feel the spring mattress is more appealing option.

FIRMNESS AND DURABILITY

The springs offer a spring mattress to withstand the weight of the body, which reduces the general wear and tear of the mattress. A memory foam mattress, although conforming to the shape of the body, is firm enough to support the weight of the body. Compared to a spring mattress with chronically pooling, a memory foam mattress is more durable. The memory foam provides to the more durable when in combination with other mattress materials.

TEMPERATURE SENSITIVITY

A memory foam mattress senses and adjusts to the body temperature of the person sleeping to surface, which can lead to a warm and the uncomfortable for some people. It also takes time for a memory foam mattress to adjust to the body and the room temperature, so some who have just turned the air on or may not enjoy the coolness from the bed right away. A spring mattress, on the other hand, remains independent of the sleeper's body temperature.
